TrustLayer

Demo video script

PayPal AI Hackathon 2026 · live site: **trustlayer-e5mz.onrender.com**

Full version: **about 5:00**
Submission cut: **2:58** (page 8)

THE PITCH IN ONE SENTENCE

TrustLayer is AI that protects the whole life of a PayPal payment: it reads the conversation before you pay, has PayPal hold the money while it decides, and settles problems before they become disputes.

THE PITCH IN 30 SECONDS (MEMORISE THIS)

Card fraud tools look at the card. But the things that break trust in PayPal, like purchase scams, disputes, surprise holds and subscription traps, happen in the conversation around a payment, and the money usually moves before anyone checks.

Our idea: **authorize first, let AI decide with evidence, then move the money.** A PayPal authorization holds the buyer's money without charging it, and voiding it costs nothing. That hold gives AI time to look, to ask someone the buyer trusts, or to settle a problem fairly.

The AI must quote the exact chat lines behind every warning, and code checks each quote. The AI advises; only code moves money. On 80 held-out chats it paused all 40 scams and wrongly paused 3 honest buyers.

SHAPE OF THE VIDEO

0:00 to 2:20 · Overview page
Part A: the story
Problem, today's answers, our idea, one payment's life, results. This is where a reviewer decides to keep watching.

2:20 to 5:00 · the live site
Part B: the live demo
Scam paused, trusted contact stops it, late parcel settled, seller health, honest subscription, audit log.

Important: video length rule. The hackathon asks for a demo video **under 3 minutes**, and judges are not obliged to watch past that. Recommended: record this full version for yourself, then upload the **2:58 submission cut on page 8** as the official Devpost video. If you also want the full 5-minute walkthrough online, upload it as a second, unlisted YouTube video and link it in the Devpost description.

How to read the scene pages: left column **DO** is what you click or scroll, in order. Right column **SAY** is the narration. **Orange** = scroll, **green** = point the cursor at it, `Button` = click it. Grey italic lines in SAY are cues, not words to read.

Before you press record

About 15 minutes of setup. Doing it in this order means nothing is slow or surprising on camera.

1. Wake the site and reset it

1. Open **trustlayer-e5mz.onrender.com**. The free server sleeps; the first load can take about 50 seconds. Wait until the Overview page appears.
2. Click the `Audit log` tab, then `Reset demo`, then `OK`. This clears old orders and starts a fresh audit log.

2. Start a TrustLayer Plus trial (off camera)

1. Click `Subscriptions`. On the **TrustLayer Plus** card, click the yellow `PayPal Subscribe` button.
2. Log in with the **sandbox buyer** account (`SANDBOX_BUYER_EMAIL` and password from your `.env`) and approve.
3. A "TrustLayer Plus · Free trial" card now sits under **Your subscriptions**. Leave it there for scene B5.
4. Bonus: PayPal now remembers your login, so the checkout popups on camera are fast.

3. Browser

1. Chrome, one window, maximised, zoom **100%** (`Ctrl` + `0`). 110% is fine if text looks small in the recording.
2. Hide the bookmarks bar (`Ctrl` + `Shift` + `B`) and close other tabs.
3. Allow pop-ups for the site (the PayPal window is a popup).
4. Turn on Windows **Do not disturb** so no notifications appear.

4. Recorder

1. OBS Studio, or Xbox Game Bar (`Win` + `Alt` + `R` starts and stops). 1080p, 30 fps.
2. Do a 10-second mic test and listen back. Quiet room, phone on silent.
3. Finally: click the `Overview` tab and make sure you are at the very top of the page.

Pace and editing

Speak slowly, about 150 words a minute; the SAY text is sized for that. It is fine to stop talking while PayPal or the AI is loading: cut that dead time afterwards in **Clipchamp** (built into Windows). If you stumble, pause two seconds and repeat the sentence; trim the mistake later. Keep the cursor still while you talk about something, and move it slowly when pointing.

PART A · OVERVIEW PAGE · 0:00 TO 2:20

The story: make them care in two minutes

0:00 to 0:15 A1 · Hook

Overview, top of page

DO

1. Start on the **Overview** tab, top of the page. Keep the mouse still for two seconds.
2. While saying "conversation", move the cursor slowly onto the **chat card on the right** (the red flagged lines).
3. On "whole life of a payment", **point at the red "Payment paused" strip** at the bottom of that card.

SAY

"Hi, I'm Dhruv, and this is TrustLayer.

Fraud tools look at the card. But scams, disputes and subscription traps happen in the **conversation** around a payment.

TrustLayer is AI that protects the **whole life of a payment**, built on PayPal."

0:15 to 0:45 A2 · The problem

Section "The problem"

DO

1. Click `Why we built it` under the headline. The page **scrolls by itself** to "Trust breaks at four moments".
2. As you name each moment, **point at its card**, left to right: **71%**, **43.8%**, **1.5%**, **Trial traps**.

SAY

"Trust breaks at four moments.

Before paying: purchase scams are 71% of UK authorised-push-payment fraud, and if you were tricked into paying, it usually isn't refunded.

When something goes wrong: 43.8% of chargebacks are friendly fraud, and most people say bad service pushed them there.

Sellers get flagged above a 1.5% dispute rate, often with holds they don't understand. And **every month**, free trials quietly turn into charges nobody wanted."

0:45 to 1:05 A3 · Today's answers, and where we stand

Comparison table

DO

1. **Scroll down** one section until the table "Existing tools react after the money has moved" fills the screen.
2. Sweep the cursor down the grey **"What exists today"** column.
3. Then sweep down the **blue "TrustLayer" column** on the right.

SAY

"Today's answers mostly react **after** the money has moved: generic warnings, a slow and adversarial dispute process, holds explained after the fact.

The blue column is where we stand: we act **in the moment**, with evidence, while the money can still be stopped."

1:05 to 1:35 A4 · The idea

Section "The idea"

DO

1. **Scroll down** to "Authorize first. Let AI decide with evidence. Then move the money."
2. Hold still on the headline while you read it out.
3. On each rule, **point at card 1**, then **card 2**, then **card 3**.

SAY

"The idea is simple: **authorize first, let AI decide with evidence, then move the money.**

PayPal already has the primitive. An authorization holds the buyer's money without charging it, and voiding it costs nothing.

We wrap that hold in three rules. **Hold, don't charge. Evidence, not opinions:** the AI must quote the exact chat lines, and code checks every quote. And **AI advises, but only code moves money.**"

1:35 to 2:00 A5 · One payment, five moments

Section "The story"

DO

1. **Scroll down** to "One payment, five moments, AI at each one" so all five blue circles are visible.
2. Move the cursor along the circles **1 → 2 → 3 → 4 → 5**, one per sentence.
3. On the last sentence, **point at the blue "Underneath every moment" bar**.

SAY

"Here is one payment's life. *(circle 1)* At checkout, Pay-pause reads the chat. *(2)* While the money is on hold, there's a cooling-off and a trusted contact. *(3)* If something goes wrong, an assistant settles it within the seller's policy. *(4)* When the seller gets paid, seller health warns them before a hold. *(5)* And every month after, subscriptions stay honest.

(bar) Each step is a real PayPal API call, written to a tamper-evident log."

2:00 to 2:20 A6 · Proof, then into the product

"About this site" → results → footer

DO

1. **Scroll down** to "A working marketplace, not a mock-up". Pause one second on the six numbered steps.
2. **Scroll down** to "Measured, not claimed". **Point at 40 / 40**, then **3 / 40**.
3. **Scroll to the bottom** (dark section) and click `Start with the scam listing`.

SAY

"Reviewers can try every step themselves with this guide.

And we measured it: on 80 held-out chats, scored once, it paused **all 40 scams** and wrongly paused **3 honest buyers**, each one explained in our repo.

Let's see it live. This iPhone listing is a scam."

PART B · LIVE SITE · 2:20 TO 5:00

The live demo: show, don't tell

2:20 to 2:50 B1 · Pay-pause stops a scam

iPhone 15 Pro listing

DO

1. On the iPhone page, **point at "$420.00 typically $880"**, then at the yellow **"New seller, no sales yet"** badge.
2. **Scroll down slightly** so the **Conversation** is visible. **Point at** "send $420 on paypal friends and family".
3. Click the blue `Continue to payment` in the right-hand **Checkout** card. It shows "Checking payment safety" for about 2 seconds.
4. The pop-up **"We paused this payment"** opens. **Point at** the quotes under "From the conversation", then the small grey line near the bottom (model names, "local model p=", "tactic").
5. **Point at** the black **Don't send money** button. Do not click it.

SAY

"A brand-new seller, half the usual price, and in the chat: Friends and Family, and 'no goods and services'.

I press Continue to payment. Before any money moves, three layers check it.

(pop-up opens)

Paused. It names the tactic and quotes the exact lines, and every quote was verified against the chat, so the AI can't invent evidence.

This line shows the LLM and a model we fine-tuned ourselves, which runs on a CPU and keeps this working even if the LLM is down. The big button is: don't send money."

2:50 to 3:30 B2 · Cooling-off and a trusted contact

Pause pop-up → PayPal → order page

DO

1. In the pop-up, click the grey link `I know this seller personally, continue with safeguards`.
2. In **Trusted contact**, type **Mom**. Click `Continue to PayPal`.
3. On the right, click the yellow `PayPal` button. In the PayPal window, click the yellow button at the bottom (**Continue** or **Complete Purchase**).
4. You land on the order page: red **"Cooling-off in progress"** with a **countdown (2:00)**. Point at it.
5. In that red box click `Open their view`. A new tab opens: "Can you double-check a payment?"
6. Click the red `Stop this payment`. **Point at** "Payment stopped. No money moved."

If the PayPal button doesn't appear, open "PayPal button not loading? Use redirect checkout" under it, approve in the new tab, then click **I've approved it**.

SAY

"But say I insist. I continue with safeguards, and add Mom as a trusted contact.

(PayPal window)

PayPal only **authorizes** the payment. It's a hold, not a charge.

A cooling-off timer starts, two minutes here, twenty-four hours in production, because scams rely on urgency. And Mom gets a summary of the warning signs.

(Mom's tab)

Mom says stop. The authorization is voided. **Zero dollars charged.**"

3:30 to 4:05 B3 · A late parcel, settled before a dispute

Canon AE-1 listing → order page

DO

1. Close Mom's tab (`Ctrl` + `W`). Click the `Marketplace` tab, then the **Canon AE-1 Program** card.
2. Click `Continue to payment`. A green **"No risk found"** card appears. **Point at it.**
3. Click the yellow `PayPal` button and approve in the PayPal window. The order page shows **On hold**.
4. In **Resolution center** (right), click the grey chip `It arrived 4 days late and I missed my trip.`, then the blue send arrow.
5. Wait about 2 seconds. A green offer appears ("$18.00 back to you"; the amount can vary). Click `Accept offer`.
6. **Point at** the **Payment** card: "Released to buyer" and "Captured". Then click `Pay out seller`.

SAY

"Now an honest seller. No risk found, so it's a normal PayPal hold.

(after approving)

The parcel arrived four days late, and that's how disputes start. The assistant, acting for the seller, offers a partial refund **within the seller's policy**, and code enforces that limit, so the AI can't promise money it isn't allowed to.

I accept. PayPal captures less and releases the rest of the hold. **No dispute was ever opened.** And the seller is paid through PayPal Payouts."

4:05 to 4:17 B4 · Seller health

Seller health → GadgetHub Outlet

DO

1. Click the `Seller health` tab, then the **GadgetHub Outlet** row.
2. **Point at** the red dispute rate and the black **1.5%** line on the gauge, then the bar "Without early resolution".
3. Move to **Recommended next steps** on the right.

SAY

"Sellers fear holds that come with no warning. GadgetHub is over the 1.5% line, and would be even higher without early resolution. The AI explains why, in plain English, with next steps."

4:17 to 4:40 B5 · Subscriptions without the trap

Subscriptions tab

DO

1. Click the `Subscriptions` tab. The **TrustLayer Plus · Free trial** card is at the top (you created it before recording).
2. At the bottom of that card click `Simulate +5 days`. After a second a yellow reminder appears. **Point at** its headline and "Our recommendation: cancel".
3. Click `Cancel subscription`, then the red `Cancel now`.

SAY

"Subscriptions without the trap, on PayPal Subscriptions. I move this trial forward five days.

Two days before the first charge, the reminder tells me honestly that I haven't used it, and suggests cancelling. The date and amount are written by code, not the AI.

Cancelling is one confirmation."

4:40 to 4:50 B6 · Audit log

Audit log tab

DO

1. Click the **Audit log** tab. Click **Verify chain**: a toast says "Recomputed N hashes: chain intact."
2. Click **Simulate tampering**. The box turns red, "Tampering detected at record #...", and that row is highlighted. **Point at the red row.**

SAY

"Every PayPal call and every AI decision is hash-chained. Verify: intact. Now I edit one record behind the app's back, and the break is found, at the exact record."

4:50 to 5:00 B7 · Close

Overview tab

DO

1. Click the **Overview** tab (back to the headline). Keep the mouse still.
2. Stop recording two seconds after you finish speaking.

SAY

"TrustLayer: AI at every moment of a payment, with PayPal holding the money while it thinks. Thanks for watching."

Optional extra (+20 s), only if you are under time: the sellers' subscriptions kit

Do: after B5, click **Seller health** → **Maya's Vintage Cameras** → in **Subscriptions kit** click **New offering**. Name: **Film Club Plus**. In "What subscribers get" type: **Two rolls of film a month. 6-month minimum, call us to cancel.** Click **Review terms**. Red "Not allowed" boxes appear and **Publish on PayPal** stays disabled.

Say: "Sellers get the same kit. The AI reviews their terms, and code blocks traps like call-to-cancel or minimum terms before anything reaches PayPal."

If something goes wrong on camera

WHAT HAPPENS	WHAT TO DO OR SAY
The site is slow on the first load	You woke it too late. Stop, wait until it loads, start again. Always open it a few minutes before recording.
The PayPal window is slow or doesn't open	Keep talking about the hold; cut the wait in editing. If it never opens, use "PayPal button not loading? Use redirect checkout".
The model line says "LLM unavailable: rules + local model"	Groq is busy and the app fell back. Say: "The hosted AI is busy right now, so our own model and rules took over. That fallback is a feature." Then carry on.
The offer amount isn't $18	Normal: the assistant decides within policy. Read the amount on screen.
The resolution assistant asks a question instead of offering	Type "Yes, a partial refund is fine." and press send.
You clicked the wrong thing	Pause, go back, redo the step. Trim it in editing. Audit log → Reset demo if you need a clean start (then redo the Plus trial).

FOR THE DEVPOST UPLOAD

Submission cut: 2:58

Same recording flow, shorter lines. Skip A3 and the payout, and turn B4 to B6 into a quick montage. Read only the lines below.

TIME	DO	SAY
0:00–0:10	Overview, top. Point at the chat card.	"This is TrustLayer: AI that protects the whole life of a PayPal payment, from the chat before you pay to the subscription after."
0:10–0:30	**Why we built it**. Point at 71% and 43.8%.	"Purchase scams are 71% of UK push-payment fraud, and if you were tricked, it's rarely refunded. 43.8% of chargebacks are friendly fraud. Trust breaks in the conversation, and money moves before anyone checks."
0:30–0:55	**Scroll** past the table to "The idea". Point at cards 1, 2, 3.	"Today's tools react after the money moves. Our idea: authorize first, let AI decide with evidence, then move the money. A PayPal authorization holds the money without charging it. The AI must quote its evidence, and only code moves money."
0:55–1:10	**Scroll** to the five circles, sweep 1→5. Scroll to the bottom, click **Start with the scam listing**.	"One payment, five moments: checkout, hold, problems, payout, subscriptions. On 80 held-out chats it paused all 40 scams. Let's see it."
1:10–1:38	B1: **Continue to payment** → pause pop-up. Point at the quotes.	"New seller, half price, asking for Friends and Family. Paused before any money moves. It names the tactic and quotes the exact lines, each one verified, and our own fine-tuned model backs it up if the LLM is down."
1:38–2:08	B2: safeguards → Mom → PayPal approve → **Open their view** → **Stop this payment**.	"If I insist, PayPal only holds the money. A cooling-off starts and Mom gets the warning signs. Mom says stop: the authorization is voided, zero charged."
2:08–2:35	B3: Canon → approve → late chip → send → **Accept offer**.	"An honest seller, a late parcel. The assistant offers a refund within the seller's policy, enforced by code. Accept: PayPal captures less and releases the rest. No dispute."
2:35–2:50	Montage, about 5 s each: GadgetHub gauge → Plus card after **Simulate +5 days** → Audit log **Simulate tampering**.	"Sellers see dispute risk before a hold. Subscriptions remind you honestly before the first charge. And every PayPal call and AI decision is tamper-evident."
2:50–2:58	**Overview** tab.	"TrustLayer: AI at every moment of a payment. Thanks for watching."

Upload checklist. YouTube → Create → Upload video. Title: *TrustLayer: AI that protects the whole life of a PayPal payment*. Visibility: **Public** (the rules need a public video). In the description, paste the live URL and the GitHub link. Copy the YouTube link into the Devpost "Video demo link" field, and submit on Devpost before **13 Nov 2026, 01:30 IST**.
